HOW TO PLANT AND CARE FOR ROSES

Roses for best results should be planted deep in good, rich soil, and cut back to within 8 or 10 inches of the ground. There is nothing gained by leaving a long top on a newly planted rose. The disturbed roots have not the strength to supply the old top, but when cut back and well soaked with water the sprouts soon appear. Many roses which are thought dead will soon start growing if treated this way. They require much watering until they start growing.

Roses with the exception of the hardy Rugosa varieties should be cut back each spring to within a foot of the ground. The hardy Rugosa Roses require no covering in the fall. Nearly all other varieties require winter protection. Cover with straw or leaves and burlap, or bank them up with dirt or peat soil (humus). Climbing roses should be taken down, the strands tied together and laid flat on the ground, weighted down, and covered with straw or peat.
